*$p < .1$; **$p < .05$; ***$p < .01$

Note. Models 1–4 are weighted least squares at the county level, with within-county sample sizes, adjusted by sampling weights, as weights. Model 5 is weighted least squares at the individual level with state-year fixed effects. Standard errors, in parentheses, are clustered at the county level in model 5. There are 50 counties in model 5.

Table 2

This table isn't quite right. The data contain missing values. CEM will match on them; see the manual for other options.

Note. Model 1 is the first-stage relationship. Models 2–5 are weighted two-stage least-squares models, with weights as given in table 1. Standard errors are in parentheses.

Note. Columns 1, 3, and 5 simply include proportion black in the year 2000 as an additional control to the baseline specification from table 1. Columns 2, 4, and 6 use sequential g-estimation (Seq, g-est) of Vansteelandt (2009). WLS = weighted least squares. Standard errors are in parentheses.

Figure 5

Georgia Gubernatorial Election, 1851

Mississippi Gubernatorial Election, 1851
Within-state relationship between proportion slave in 1850 in a county and percentage voting for Unionist candidates in 1851 in that county. Both Howell Cobb and Henry Foote were running against strong States' Rights supporters in the aftermath of the Compromise of 1850. Higher values on each y-axis indicate more moderate voting with regard to slavery and secession.
